

Soil-Sement®

Dust and Erosion Control Agent

CASE HISTORY

LIMESTONE QUARRY

Haul Road Surface Problems and Environmental Risks Eliminated at a Cement Company

A limestone quarry and cement company in Canada was having problems with dust and rough potholed roads at their limestone quarry. In addition, they had been using a product which would wash off their roads during heavy rains, flow into streams which pass through their neighbors' properties, and flow into one of the Great Lakes. Because of this product's high BOD, this was not acceptable.

Midwest Industrial Supply, Inc. provided a cost effective Soil-Sement® Road Maintenance Program which produced a dust-free, smooth road surface and eliminated these surface problems and environmental risks and created a road surface that withstands haul road truck and plant traffic.

Midwest Industrial Supply, Inc. can provide installation of Control Programs based on the unique requirements of each specific project. Our field technical service personnel are available for consultation and recommendations to determine the program best suited for each project's requirements. Midwest Industrial Supply, Inc. can also provide a complete record-keeping and reporting system as part of its service.
