

Soil-Sement®

Dust and Erosion Control Agent

CASE HISTORY

WINERY

Dust and Erosion Control Provided to Meet the Specific Needs and High Standards of the Wine Producing Industry

Chronic dust and erosion problems from unpaved roadways and parking areas have plagued wineries and vineyards for years. Dust related disease and mites, dust from grapes forming sledge in the bottom of presses, health and safety hazards, as well as costly maintenance and operating conditions are problems winemakers strive to eliminate. Vine type, soil, climate, and the hand of the winemaker all play important roles in shaping the characteristics of fine wine. Protect the perfect ending by not allowing fugitive dust to enter the equation.

Midwest Industrial Supply, inc. has worked with winemakers to develop Dust and Erosion Control Programs to meet the specific needs and high standards of the wine producing community. Soil-Sement® is providing complete and cost effective dust and erosion control for prestigious wineries throughout California. Soil-Sement® is environmentally safe, will not cause harm to vegetation and reduces potholes and rutting while providing lower maintenance and operating costs and improving productivity and morale.

Midwest Industrial Supply, Inc. can provide installation of Control Programs based on the unique requirements of each specific project. Our field technical service personnel are available for consultation and recommendations to determine the program best suited for each project's requirements. Midwest Industrial Supply, Inc. can also provide a complete record-keeping and reporting system as part of its service.
